Environmental Management Framework

There are several models for environmental management frameworks, but the HEI has followed the Plan-Do-Check-Act (PDCA) cycle model which is also known as the Deming Cycle or the Shewhart Cycle. Here's a brief overview of each stage within the PDCA cycle:

Plan:
In this stage, the HEI establishes objectives and processes necessary to deliver results in accordance with their environmental policy and comply with legal requirements. This involves setting goals, identifying potential environmental impacts, and developing strategies to address them.

Do:
This stage involves implementing the plans developed in the previous stage. It includes training employees, implementing procedures and controls, and carrying out activities to achieve the environmental objectives set forth in the planning stage.

Check:
In this stage, HEI evaluates the results of the implementation against the objectives and expectations, and analyzes the data collected during the Do phase.

Act:
In this stage the HEI takes appropriate action based on the results. This could involve refining the plan, making adjustment or implementing it on a large scale.
